

PROFESSOR HOOT'S OBSERVATION TIP

LOOK AGAIN!

Professor Hoot knows that great discoveries can begin with something very simple:

Looking carefully.

Sometimes we think we know what we saw after just one quick look. But scientists know a secret...

★ Look once. Then look again! ★

TRY THE HOOT METHOD

When you discover something interesting, ask yourself:

1

WHAT DO I SEE?

Describe only what you can actually observe.

2

WHAT DO I NOTICE?

Look for shapes, colors, movement, patterns, or changes.

3

WHAT CHANGED?

Compare what you see now with what you observed before.

4

WHAT DO I WONDER?

What new question does your observation make you want to ask?

THINK LIKE A SCIENTIST

Snickers thought the moon was disappearing.

- ★ But she kept looking.
- ★ She compared what she saw.
- ★ She asked questions.
- ★ She tried an experiment.

And eventually, her observations helped her discover what was really happening.

She looked.

She compared.

She asked.

She experimented.

She discovered!

PROFESSOR HOOT SAYS...

“ The first thing you notice might begin the mystery.
The second look might help you solve it. ”

So when something makes you curious...

Stop. Look closely. Look again.

And keep wondering. ♡

Curiosity
+ Careful
Observation
= Discovery!
